Digital Signal Processing: Pearson New International

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

In digital signal processing, downsampling and decimation are terms associated with the process of resampling in a multi-rate digital signal processing system. Both terms are used by various authors to describe the entire process, which includes lowpass filtering, or just the part of the process that does not include filtering. When downsampling (decimation) is performed on a sequence of ...

El Procesamiento de Señales Digitales o DSP (sigla en inglés de Digital Signal Processing) es la manipulación matemática de una señal de información para modificarla o mejorarla en algún sentido. Este está caracterizado por la representación en el dominio del tiempo discreto, en el dominio frecuencia discreta, u otro dominio discreto de señales por medio de una secuencia de números o ...

El audio digital es la codificación digital de una señal eléctrica que representa una onda sonora. Consiste en una secuencia de valores enteros y se obtiene de dos procesos: el muestreo y la cuantificación digital de la señal eléctrica.

@mujtaba: Yes, there is an advantage in using root raised cosine in receiver. Typical receivers have additive white gaussian noise and matched filtering helps one to maximize the signal to noise ratio in that scenario.

@Philips: I do not know much about the channel model for power line communications (except that the channel is a wire, ofcourse). However, for OFDM aspect may I point to couple of articles which I have written in the past.

Prinzipielles Vorgehen. Die Menge der gleitenden Mittelwerte wird iterativ (â€žgleitendâ€œ) Ã¼ber einen Ausschnitt, das â€žFensterâ€œ, eines gegebenen Signals berechnet. Das verwendete Fenster wird Ã¼berlappend verschoben, d. h. wiederholt wird der erste Wert aus dem betrachteten Ausschnitt gestrichen, der erste Wert nach dem Ausschnitt hinzugenommen und ein neuer Mittelwert berechnet.
