The term "isometric" comes from the Greek for "equal measure", reflecting that the scale along each axis of the projection is the same (unlike some other forms of graphical projection).. An isometric view of an object can be obtained by choosing the viewing direction such that the angles between the projections of the x, y, and z axes are all the same, or  $120^\circ$ .

The orthographic projection is derived from the principles of descriptive geometry and is a two-dimensional representation of a three-dimensional object. It is a parallel projection (the lines of projection are parallel both in reality and in the projection plane).

A: Is the Orthogonal Isometric projection where the x & y axis are set at 45 degrees to the picture plane. As a result the x & y axis are orthogonal to each other (or at 90 degrees). In illustrations this can be best described as a Centered Orthogonal Projection.

The distortion is a simple rotation of just 17 degrees, but the results are not very nice at all. First of all each new pixel location is a floating point value, but pixels can only exist in an integer grid, so the above simply junks the non-integer fraction of the results.
