Sensory and Motor Control. Structure of The Brain. The brain has descending motor control on reflexes arcs and receives ascending information from the spinal cord. It also gives feedback about the outcome (assisted learning). ... The thalamus is involved in sensory and motor signal relay and the regulation of consciousness and sleep.

Sensory feedback from skeletal muscle is critical for proper sensory-motor control. This feedback is provided by specialized receptors in muscle that include muscle spindles, Golgi tendon organs, and joint feedback and is key to maintaining dynamic and static muscle tone.

Classes of control. In general, optimizing motor performance is achieved through three classes of control: predictive or feedforward control, which is critical given the feedback delays in the sensorimotor system; reactive control, which involves the use of sensory inputs to update ongoing motor commands; and biomechanical
