A Markov chain is a stochastic model describing a sequence of possible events in which the probability of each event depends only on the state attained in the previous event.. In probability theory and related fields, a Markov process, named after the Russian mathematician Andrey Markov, is a stochastic process that satisfies the Markov property (sometimes characterized as "memorylessness").

this was a book i quite liked when i was in grad school, enough for me to go back and buy it even though i had a mediocre PDF scan of the book. it is definitely aimed at advanced undergraduate to starting grad students with quick overview of probability in terms of sigma algebra and measure theory, and then it gets right into it with markov chains, linear algebra, blah blah. the main points i ...

In queueing theory, a discipline within the mathematical theory of probability, an M/M/1 queue represents the queue length in a system having a single server, where arrivals are determined by a Poisson process and job service times have an exponential distribution. The model name is written in Kendall's notation. The model is the most elementary of queueing models and an attractive object of ...

In neural networks, the learning rate of the gradient descent is a crucial hyperparameter, whose tuning is time-consuming and prevents out-of-the-box training of a model.

Talk slides not corresponding to papers (mostly expository): The diamond lemma and its applications (May 2018, Student Combinatorics Seminar, UMN Minneapolis). Sourcecode. This is an exposition of Newman's diamond lemma, with (an outline of a) constructive proof and a few applications (including a glimpse at Gröbner bases).
