1 NEWTON'S PARTICLE THEORY OF LIGHT Light is made up of little particles. They obey the same laws of physics as other masses like baseballs and planets.

straight lines. This idea that light travels through space along straight lines, although not strictly correct, is the basis of the very useful ray model of light, which explains a great deal about how we see things. The elements of the ray theory, called geometrical optics, will be explored in chapters L2 and L3.

corpuscular theory was discarded. Huygens's wave theory of light: Huygens put forward his wave theory according to which light energy propagated in the form of wave, with the help of wave theory he could successfully explain the phenomenon of reflection and refraction, interference and diffraction all.

Corpuscular theory predicted that speed of light in rarer medium is smaller than speed of light in denser medium. This was experimentally proved wrong by Foucault. If light consists of material particles, emission of light from a source should cause reduction in the mass of the source of light.
